

\mathfrak{sl}_N web algebras and categorified Howe duality

Marco Mackaay
(joint with Pan-Tubbenhauer and Yonezawa)

CAMGSD and University of the Algarve, Portugal

September 3, 2013

Main question

What is the relation between the three combinatorial approaches to categorification in type A ?

Part of the answer

Categorified skew Howe duality!

The general and special linear quantum groups

Definition

- i) $U_q(\mathfrak{gl}_n)$ is generated by $K_1^{\pm 1}, \dots, K_n^{\pm 1}, E_{\pm 1}, \dots, E_{\pm(n-1)}$, subject to $(\alpha_i = \epsilon_i - \epsilon_{i+1} = (0, \dots, 1, -1, \dots, 0) \in \mathbb{Z}^{n-1})$:

$$K_i K_j = K_j K_i \quad K_i K_i^{-1} = K_i^{-1} K_i = 1$$

$$E_i E_{-j} - E_{-j} E_i = \delta_{i,j} \frac{K_i K_{i+1}^{-1} - K_i^{-1} K_{i+1}}{q - q^{-1}}$$

$$K_i E_{\pm j} = q^{\pm(\epsilon_i, \alpha_j)} E_{\pm j} K_i$$

+ some extra relations we won't need today

- ii) $U_q(\mathfrak{sl}_n) \subseteq U_q(\mathfrak{gl}_n)$ is generated by $K_i K_{i+1}^{-1}$ and $E_{\pm i}$.

Idempotent quantum groups

Definition (Beilinson-Lusztig-MacPherson)

For each $\lambda \in \mathbb{Z}^n$, adjoin an idempotent 1_λ and add the relations

$$\begin{aligned}1_\lambda 1_\mu &= \delta_{\lambda,\mu} 1_\lambda \\ E_{\pm i} 1_\lambda &= 1_{\lambda \pm \alpha_i} E_{\pm i} \\ K_i 1_\lambda &= q^{\lambda_i} 1_\lambda.\end{aligned}$$

Define

$$\dot{\mathbf{U}}_q(\mathfrak{gl}_n) = \bigoplus_{\lambda, \mu \in \mathbb{Z}^n} 1_\lambda \mathbf{U}_q(\mathfrak{gl}_n) 1_\mu.$$

Define $\dot{\mathbf{U}}_q(\mathfrak{sl}_n)$ similarly by adjoining idempotents 1_μ to $\mathbf{U}_q(\mathfrak{sl}_n)$ for $\mu \in \mathbb{Z}^{n-1}$.

Definition (Cautis-Kamnitzer-Morrison)

The objects of $\mathcal{Sp}(\mathrm{SL}_N)$ are finite sequences \vec{k} of elements in $\{0^\pm, \dots, (N)^\pm\}$.

$\mathrm{Hom}(\vec{k}, \vec{l})$ is generated by:

with all labels between 0 and N .

Definition

Modulo:

$$\begin{array}{c}
 \begin{array}{c} N-a \\ \nearrow \\ a \end{array} \\
 \\
 \begin{array}{c} b+a \\ \uparrow \\ b \circlearrowleft a \\ \uparrow \\ b+a \\ a \end{array} \\
 \\
 \begin{array}{c} b+a \\ \uparrow \\ b \circlearrowleft b+a \\ \uparrow \\ a \end{array}
 \end{array}
 =
 \begin{array}{c}
 (-1)^{a(N-a)} \begin{array}{c} N-a \\ \nearrow \\ a \end{array} \\
 \\
 \left[\begin{array}{c} a+b \\ a \end{array} \right]_q \uparrow b+a \\
 \\
 \left[\begin{array}{c} N-a \\ b \end{array} \right]_q \uparrow a
 \end{array}$$

+ rels by reflections and/or arrow reversals;

Definition (Cautis-Kamnitzer-Morrison)

$$\begin{array}{c}
 \begin{array}{ccc}
 \begin{array}{c} \text{Diagram 1: A vertex with three outgoing arrows. Top arrow labeled } a+b+c. \text{ Bottom-left arrow labeled } a+b. \text{ Bottom-right arrow labeled } c. \text{ The bottom-left arrow is further split into two arrows labeled } a \text{ and } b. \end{array}
 & = &
 \begin{array}{c} \text{Diagram 2: A vertex with three outgoing arrows. Top arrow labeled } a+b+c. \text{ Bottom-left arrow labeled } a. \text{ Bottom-right arrow labeled } c. \text{ The bottom-right arrow is further split into two arrows labeled } b \text{ and } c. \end{array}
 \end{array}
 \\
 \\
 \begin{array}{ccc}
 \begin{array}{c} \text{Diagram 3: A square with four vertical arrows. Left side: top arrow } a-s-t, \text{ middle arrow } a-s, \text{ bottom arrow } a. \text{ Right side: top arrow } b+s+t, \text{ middle arrow } b+s, \text{ bottom arrow } b. \text{ Two horizontal arrows connect the sides: top arrow labeled } t, \text{ bottom arrow labeled } s. \end{array}
 & = &
 \begin{array}{c} \text{Diagram 4: A square with four vertical arrows. Left side: top arrow } a-s-t, \text{ middle arrow } a, \text{ bottom arrow } a. \text{ Right side: top arrow } b+s+t, \text{ middle arrow } b, \text{ bottom arrow } b. \text{ Two horizontal arrows connect the sides: top arrow labeled } s+t, \text{ bottom arrow labeled } t. \end{array}
 \end{array}
 \\
 \\
 \begin{array}{ccc}
 \begin{array}{c} \text{Diagram 5: A square with four vertical arrows. Left side: top arrow } a-s+t, \text{ middle arrow } a-s, \text{ bottom arrow } a. \text{ Right side: top arrow } b+s-t, \text{ middle arrow } b+s, \text{ bottom arrow } b. \text{ Two horizontal arrows connect the sides: top arrow labeled } t, \text{ bottom arrow labeled } s. \end{array}
 & = &
 \sum_r \begin{bmatrix} a-b+t-s \\ r \end{bmatrix}_q \begin{array}{c} \text{Diagram 6: A square with four vertical arrows. Left side: top arrow } a-s+t, \text{ middle arrow } a+t-r, \text{ bottom arrow } a. \text{ Right side: top arrow } b+s-t, \text{ middle arrow } b+r-t, \text{ bottom arrow } b. \text{ Two horizontal arrows connect the sides: top arrow labeled } s-r, \text{ bottom arrow labeled } t-r. \end{array}
 \end{array}
 \end{array}$$

+ rels by reflections and/or arrow reversals.

let $N, m, d \geq 0$ be arbitrary integers.

Definition (N -bounded \mathfrak{gl}_m -weights)

Let

$$\Lambda(m, d)_N := \{\vec{k} \in \{0, \dots, N\}^m \mid k_1 + \dots + k_m = d\}.$$

Define

$$\phi_{m,d,N}: \mathbb{Z}^{m-1} \rightarrow \Lambda(m, d)_N \cup \{*\}$$

by

$$\begin{aligned} \phi_{m,d,N}(\lambda) &= \vec{k} && \text{if} \\ k_i - k_{i+1} &= \lambda_i && \text{and} \quad \sum_{i=1}^m k_i = d. \end{aligned}$$

Proposition (Cautis-Kamnitzer-Morrison)

$$\gamma_{m,d,N}: \dot{\mathbf{U}}_q(\mathfrak{sl}_m) \rightarrow \mathcal{S}p(\mathrm{SL}_N)$$

is a well-defined full functor: (assume $\phi_{m,d,N}(\lambda) = \vec{k}$)

$$1_\lambda \mapsto \begin{array}{ccccccc} & \uparrow & \uparrow & & \uparrow & \uparrow & \\ k_m & | & k_{m-1} & & k_2 & | & k_1 \end{array}$$

$$E_{+i}1_\lambda \mapsto \begin{array}{ccccccc} & \uparrow & & \uparrow & k_{i+1}+1 & & \uparrow & k_i+1 & & \uparrow & & \uparrow \\ & k_m & \dots & k_{i+2} & | & k_{i+1} & \nearrow 1 & k_i & & k_{i-1} & & k_1 \end{array}$$

$$E_{-i}1_\lambda \mapsto \begin{array}{ccccccc} & \uparrow & & \uparrow & k_{i+1}+1 & & \uparrow & k_{i-1} & & \uparrow & & \uparrow \\ & k_m & \dots & k_{i+2} & | & k_{i+1} & \nwarrow 1 & k_i & & k_{i-1} & & k_1 \end{array}$$

Divided powers

Recall

$$E_{+i}^{(a)} := E_{+i}^a / [a]! \quad \text{and} \quad E_{-i}^{(a)} = E_{-i}^a / [a]!$$

$$E_{+i}^{(a)} 1_\lambda \mapsto$$

$$E_{-i}^{(a)} 1_\lambda \mapsto$$

Examples

$$\begin{array}{ccc}
 \begin{array}{c}
 \begin{array}{ccccc}
 a-s-t & & & & b+s+t \\
 & \nearrow t & & & \\
 a-s & & & & b+s \\
 & \nearrow s & & & \\
 a & & & & b
 \end{array} \\
 \\
 E_+^{(s)} E_+^{(t)} 1_{(b,a)}
 \end{array}
 & = &
 \begin{array}{c}
 \begin{array}{ccccc}
 a-s-t & & & & b+s+t \\
 & \nearrow s+t & & & \\
 a & & & & b
 \end{array} \\
 \\
 \left[\begin{array}{c} s+t \\ t \end{array} \right]_q E_+^{(s+t)}
 \end{array}
 \end{array}$$

Examples

$$\begin{array}{c}
 \begin{array}{ccc}
 a-s-t & & b+s+t \\
 \uparrow & \nearrow t & \uparrow \\
 a-s & & b+s \\
 \uparrow & \nearrow s & \uparrow \\
 a & & b
 \end{array}
 \end{array}
 =
 \begin{array}{c}
 \begin{array}{ccc}
 a-s-t & & b+s+t \\
 \uparrow & \nearrow s+t & \uparrow \\
 & & \\
 a & & b
 \end{array}
 \end{array}
 \begin{array}{c}
 \left[\begin{array}{c} s+t \\ t \end{array} \right]_q
 \end{array}$$

$$E_+^{(s)} E_+^{(t)} 1_{(b,a)} = \left[\begin{array}{c} s+t \\ t \end{array} \right]_q E_+^{(s+t)}$$

$$\begin{array}{c}
 \begin{array}{ccc}
 a-s+t & & b+s-t \\
 \uparrow & \nwarrow t & \uparrow \\
 a-s & & b+s \\
 \uparrow & \nearrow s & \uparrow \\
 a & & b
 \end{array}
 \end{array}
 =
 \sum_r \left[\begin{array}{c} a-b+t-s \\ r \end{array} \right]_q
 \begin{array}{c}
 \begin{array}{ccc}
 a-s+t & & b+s-t \\
 \uparrow & \nearrow s-r & \uparrow \\
 a+t-r & & b+r-t \\
 \uparrow & \nwarrow t-r & \uparrow \\
 a & & b
 \end{array}
 \end{array}$$

$$E_+^{(s)} E_-^{(t)} 1_{(b,a)} = \sum_r \left[\begin{array}{c} a-b+t-s \\ r \end{array} \right]_q E_-^{(t-r)} E_+^{(s-r)}$$

A special case

Suppose $d = m = N\ell$ and $\Lambda = N\omega_\ell$. Note that

$$\phi_{m,m,N}(\Lambda) = (N^\ell) \in \Lambda(m,m)_N.$$

Definition (M.M-Yonezawa)

Define the $\dot{\mathbf{U}}_q(\mathfrak{sl}_m)$ -*web module* with highest weight Λ by

$$W_\Lambda := \bigoplus_{\vec{k} \in \Lambda(m,m)_N} W(\vec{k}, N),$$

where $W(\vec{k}, N)$ is the *web space* defined by

$$W(\vec{k}, N) := \text{Hom}((N^\ell), \vec{k}).$$

in $\mathcal{S}p(\text{SL}(N))$.

The web module is irreducible

Definition (M.M.-Yonezawa)

Define the q -sesquilinear web form by

$$\langle u, v \rangle := q^{d(\vec{k})} \text{ev}(u^* v) \in \mathbb{C}(q) \quad (1)$$

for any two monomial webs $u, v \in W(\vec{k}, N)$, with

$$d(\vec{k}) = 1/2(N(N-1)\ell - \sum_{i=1}^m k_i(k_i-1)).$$

The web module is irreducible

Definition (M.M.-Yonezawa)

Define the q -sesquilinear web form by

$$\langle u, v \rangle := q^{d(\vec{k})} \text{ev}(u^* v) \in \mathbb{C}(q) \quad (1)$$

for any two monomial webs $u, v \in W(\vec{k}, N)$, with

$$d(\vec{k}) = 1/2(N(N-1)\ell - \sum_{i=1}^m k_i(k_i - 1)).$$

Corollary (M.M.-Yonezawa)

W_Λ is an irreducible $\dot{U}_q(\mathfrak{sl}_m)$ -representation with highest weight Λ . The q -sesquilinear web form is equal to the q -Schapovalov form.

And now the categorification...

Matrix factorizations

Let $R = \mathcal{C}[\mathbb{X}] = \mathbb{C}[X_1, \dots, X_k]$ and suppose $\deg(X_i) \in 2\mathbb{N}$.

Definition

A *graded matrix factorization with homogeneous potential* $P \in R$ is a 2-chain of free graded R -modules

$$M_0 \xrightarrow{d_{M_0}} M_1 \xrightarrow{d_{M_1}} M_0 ,$$

with

$$\deg(d_{M_0}) = \deg(d_{M_1}) = \frac{1}{2} \deg(P)$$

and

$$d_{M_1} d_{M_0} = P \operatorname{Id}_{M_0} \quad \text{and} \quad d_{M_0} d_{M_1} = P \operatorname{Id}_{M_1} .$$

The homotopy category of matrix factorizations with potential P , denoted $\operatorname{HMF}_R(P)$, is *Krull-Schmidt*.

Matrix factorizations

Let $R = \mathcal{C}[\mathbb{X}]$, $R' = \mathcal{C}[\mathbb{Y}]$, $Q = \mathcal{C}[\mathbb{X} \cup \mathbb{Y}]$ and $S = \mathcal{C}[\mathbb{X} \cap \mathbb{Y}]$.

Definition

For $\widehat{M} \in \text{HMF}_R(P)$ and $\widehat{N} \in \text{HMF}_{R'}(P')$, we define

$$\widehat{M} \boxtimes_S \widehat{N} \in \text{HMF}_Q(P + P').$$

Matrix factorizations

Let $R = \mathcal{C}[\mathbb{X}]$, $R' = \mathcal{C}[\mathbb{Y}]$, $Q = \mathcal{C}[\mathbb{X} \cup \mathbb{Y}]$ and $S = \mathcal{C}[\mathbb{X} \cap \mathbb{Y}]$.

Definition

For $\widehat{M} \in \text{HMF}_R(P)$ and $\widehat{N} \in \text{HMF}_{R'}(P')$, we define

$$\widehat{M} \boxtimes_S \widehat{N} \in \text{HMF}_Q(P + P').$$

Definition

Given $\widehat{N} = (N_0, N_1, d_{N_0}, d_{N_1}) \in \text{HMF}_R(P)$, one can define its dual by

$$\widehat{N}_\bullet = (N_0^*, N_1^*, -d_{N_1}^*, d_{N_0}^*) \in \text{HMF}_R(-P),$$

where $N^* = \text{HOM}_R(N, R)$.

We define the structure of a 2-complex on $\mathrm{HOM}_R(\widehat{M}, \widehat{N})$ by

Definition

$$\mathrm{HOM}_R^0(\widehat{M}, \widehat{N}) \xrightarrow{d_0} \mathrm{HOM}_R^1(\widehat{M}, \widehat{N}) \xrightarrow{d_1} \mathrm{HOM}_R^0(\widehat{M}, \widehat{N}),$$

where

$$\mathrm{HOM}_R^0(\widehat{M}, \widehat{N}) = \mathrm{HOM}_R(M_0, N_0) \oplus \mathrm{HOM}_R(M_1, N_1),$$

$$\mathrm{HOM}_R^1(\widehat{M}, \widehat{N}) = \mathrm{HOM}_R(M_0, N_1) \oplus \mathrm{HOM}_R(M_1, N_0),$$

and

$$d_i(f) = d_N f + (-1)^i f d_M \quad (i = 0, 1).$$

The cohomology of this complex is denoted by

$$\mathrm{EXT}(\widehat{M}, \widehat{N}) = \mathrm{EXT}^0(\widehat{M}, \widehat{N}) \oplus \mathrm{EXT}^1(\widehat{M}, \widehat{N}).$$

By definition, we have the following proposition.

Proposition

We have

$$\begin{aligned}\mathrm{EXT}^0(\widehat{M}, \widehat{N}) &\simeq \mathrm{HOM}_{\mathrm{HMF}}(\widehat{M}, \widehat{N}), \\ \mathrm{EXT}^1(\widehat{M}, \widehat{N}) &\simeq \mathrm{HOM}_{\mathrm{HMF}}(\widehat{M}, \widehat{N}\langle 1 \rangle).\end{aligned}$$

The cohomology of this complex is denoted by

$$\mathrm{EXT}(\widehat{M}, \widehat{N}) = \mathrm{EXT}^0(\widehat{M}, \widehat{N}) \oplus \mathrm{EXT}^1(\widehat{M}, \widehat{N}).$$

By definition, we have the following proposition.

Proposition

We have

$$\begin{aligned}\mathrm{EXT}^0(\widehat{M}, \widehat{N}) &\simeq \mathrm{HOM}_{\mathrm{HMF}}(\widehat{M}, \widehat{N}), \\ \mathrm{EXT}^1(\widehat{M}, \widehat{N}) &\simeq \mathrm{HOM}_{\mathrm{HMF}}(\widehat{M}, \widehat{N}\langle 1 \rangle).\end{aligned}$$

Lemma

If M is finite, we have an isomorphism

$$\mathrm{EXT}(\widehat{M}, \widehat{N}) \cong H(\widehat{M}_{\bullet} \boxtimes_R \widehat{N})$$

which preserves the q -degree.

Koszul matrix factorizations

Let $p, q \in R$ be homogeneous. We define

$$K(p; q) := R \xrightarrow{p} R' \xrightarrow{q} R$$

with $R' := R\{\frac{1}{2}(\deg(q) - \deg(p))\}$.

Koszul matrix factorizations

Let $p, q \in R$ be homogeneous. We define

$$K(p; q) := R \xrightarrow{p} R' \xrightarrow{q} R$$

with $R' := R\{\frac{1}{2}(\deg(q) - \deg(p))\}$.

More generally, for $\mathbf{p} = (p_1, p_2, \dots, p_r)$, $\mathbf{q} = (q_1, q_2, \dots, q_r) \in R^n$ we define

$$K(\mathbf{p}; \mathbf{q}) := \bigotimes_R^r K(p_i; q_i)_R.$$

MFs due to Khovanov-Rozansky, Wu, Yonezawa

To each monomial web $u \in \mathcal{S}p(\vec{k}, \vec{k}')$ we can associate a matrix factorization \hat{u} .

Example (Khovanov-Rozansky)

Define $f(x + y, xy) := x^{N+1} + y^{N+1}$. Then

$$\begin{aligned}\hat{\Gamma} &:= K((p_1, p_2); (x_1 + x_2 - x_3 - x_4, x_1x_2 - x_3x_4))\{-1\} \\ p_1 &:= \frac{f(x_1 + x_2, x_1x_2) - f(x_3 + x_4, x_1x_2)}{x_1 + x_2 - x_3 - x_4} \\ p_2 &:= \frac{f(x_3 + x_4, x_1x_2) - f(x_3 + x_4, x_3x_4)}{x_1x_2 - x_3x_4}\end{aligned}$$

We have

$$\mathrm{EXT}(\hat{u}, \hat{v}) \cong H(\hat{u} \bullet_{R^{\vec{k}}} \hat{v}) \cong H(\widehat{u^*v})\{d(\vec{k})\}\langle 1 \rangle$$

for any $u, v \in W(\vec{k}, N)$.

We have

$$\mathrm{EXT}(\hat{u}, \hat{v}) \cong H(\hat{u} \bullet_{R^{\vec{k}}} \hat{v}) \cong H(\widehat{u^*v})\{d(\vec{k})\}\langle 1 \rangle$$

for any $u, v \in W(\vec{k}, N)$.

Theorem (Khovanov-Rozansky, Wu, Yonezawa)

The matrix factorizations associated to webs satisfy all web relations up to homotopy equivalence. These equivalences are all q -degree preserving, but might involve homological degree shifts.

Categorified quantum \mathfrak{sl}_m and 2-representations

Definition (Khovanov-Lauda's $\mathcal{U}(\mathfrak{sl}_m)$)

$$\begin{array}{ll}
 \begin{array}{c} \uparrow \\ \bullet \\ \downarrow \\ i \end{array} \lambda : \mathcal{E}_{+i} \mathbf{1}_\lambda \rightarrow \mathcal{E}_{+i} \mathbf{1}_\lambda \{a_{ii}\} & \begin{array}{c} \downarrow \\ \bullet \\ \uparrow \\ i \end{array} \lambda : \mathcal{E}_{+i} \mathbf{1}_\lambda \rightarrow \mathcal{E}_{-i} \mathbf{1}_\lambda \{a_{ii}\} \\
 \begin{array}{c} i \\ \cup \\ \lambda \end{array} : \mathbf{1}_\lambda \rightarrow \mathcal{E}_{(-i,+i)} \mathbf{1}_\lambda \{\lambda_i + 1\} & \begin{array}{c} i \\ \cup \\ \lambda \end{array} : \mathbf{1}_\lambda \rightarrow \mathcal{E}_{(+i,-i)} \mathbf{1}_\lambda \{-\lambda_i + 1\} \\
 \begin{array}{c} \lambda \\ \cup \\ i \end{array} : \mathcal{E}_{(-i,+i)} \mathbf{1}_\lambda \rightarrow \mathbf{1}_\lambda \{\lambda_i + 1\} & \begin{array}{c} \lambda \\ \cup \\ i \end{array} : \mathcal{E}_{(+i,-i)} \mathbf{1}_\lambda \rightarrow \mathbf{1}_\lambda \{-\lambda_i + 1\} \\
 \begin{array}{c} \lambda+i'+l' \\ \swarrow \quad \searrow \\ i \quad l \\ \swarrow \quad \searrow \\ \lambda-i'-l' \\ i \quad l \end{array} \lambda : \mathcal{E}_{(+i,+l)} \mathbf{1}_\lambda \rightarrow \mathcal{E}_{(+l,+i)} \mathbf{1}_\lambda \{-a_{il}\} \\
 \begin{array}{c} \lambda-i'-l' \\ \swarrow \quad \searrow \\ i \quad l \\ \swarrow \quad \searrow \\ \lambda+i'+l' \\ i \quad l \end{array} \lambda : \mathcal{E}_{(-i,-l)} \mathbf{1}_\lambda \rightarrow \mathcal{E}_{(-l,-i)} \mathbf{1}_\lambda \{-a_{il}\}
 \end{array}$$

modulo relations.

Theorem (Khovanov-Lauda)

The linear map

$$\dot{\mathcal{U}}_q(\mathfrak{sl}_m) \rightarrow K_0^q(\mathcal{U}(\mathfrak{sl}_m))$$

defined by

$$q^t E_{\underline{i}} 1_{\lambda} \rightarrow \mathcal{E}_{\underline{i}} \mathbf{1}_{\lambda} \{t\}$$

is an isomorphism of algebras.

Cyclotomic KLR algebras and 2-representations

Let Λ be a dominant \mathfrak{sl}_m -weight and P_Λ the set of weights in V_Λ .

Definition (The cyclotomic Khovanov-Lauda-Rouquier algebra)

R_Λ is the quotient of $\mathcal{U}_Q(\mathfrak{sl}_m)^-$ modulo the ideal generated by

Note that

$$R_\Lambda = \bigoplus_{\mu \in P_\Lambda} R_\Lambda(\mu),$$

where $R_\Lambda(\mu)$ is the subalgebra generated by all diagrams whose left-most region is labeled μ .

The categorification theorem

Brundan and Kleshchev proved that R_Λ is finite-dimensional.

The categorification theorem

Brundan and Kleshchev proved that R_Λ is finite-dimensional.

Define

$$\mathcal{V}_\Lambda^p := R_\Lambda - \text{pmod}_{\text{gr}}.$$

Theorem (Brundan-Kleshchev)

The 2-category \mathcal{V}_Λ^p is an additive strong 2-representation of \mathfrak{sl}_m , such that

$$V_\Lambda \cong K_0^q(\mathcal{V}_\Lambda^p)$$

as $\dot{U}_q(\mathfrak{sl}_m)$ -modules.

Moreover, this isomorphism maps intertwines the q -Shapovalov form and the Euler form.

Rouquier's universality theorem

Suppose $\mathcal{C}_\Lambda := \bigoplus_{\mu \in P_\Lambda} C(\mu)$ is a graded and Krull-Schmidt additive category.

Proposition (Rouquier)

Suppose that

- \mathcal{C}_Λ is a strong 2-representation of \mathfrak{sl}_m by \mathcal{C} -linear functors;
- There exists an indecomposable object $V(\Lambda) \in \mathcal{C}(\Lambda)$ such that $\mathcal{E}_{+i} V(\Lambda) = 0$, for all i , and $\text{End}(V(\Lambda)) \cong \mathbb{C}$;
- any object in \mathcal{C}_Λ is a direct summand of $XV(\Lambda)$, for some 1-morphism $X \in \mathcal{U}_Q(\mathfrak{sl}_m)$.

Then there exists an equivalence

$$\mathcal{V}_\Lambda^p \rightarrow \mathcal{C}_\Lambda$$

of additive strong \mathfrak{sl}_m 2-representations.

Theorem (M.M.-Yonezawa)

There exists a well-defined linear 2-functor

$$\Gamma_{m,d,N} : \mathcal{U}(\mathfrak{sl}_m)^* \rightarrow \mathrm{HMF}_{m,d,N}^*.$$

On 1-morphisms

Definition

$$1_\lambda \mapsto \begin{array}{c} \frown \\ \begin{array}{ccccccc} \uparrow & \uparrow & & \uparrow & \uparrow \\ k_m & k_{m-1} & \cdots & k_2 & k_1 \end{array} \end{array}$$

$$E_{+i}1_\lambda \mapsto \begin{array}{c} \frown \\ \begin{array}{ccccccc} \uparrow & & \uparrow & k_{i+1}+1 & \uparrow & k_{i+1} & \uparrow \\ \cdots & k_{i+2} & & \swarrow 1 & k_i & \cdots & k_1 \\ k_m & & & k_{i+1} & & k_{i-1} & \end{array} \end{array}$$

$$E_{-i}1_\lambda \mapsto \begin{array}{c} \frown \\ \begin{array}{ccccccc} \uparrow & & \uparrow & k_{i+1}+1 & \uparrow & k_{i-1} & \uparrow \\ \cdots & k_{i+2} & & \nwarrow 1 & k_i & \cdots & k_1 \\ k_m & & & k_{i+1} & & k_{i-1} & \end{array} \end{array}$$

On 2-morphisms, e.g.

Ladders

Let $m = d = N\ell$ and $\Lambda = N\omega_\ell$. Recall

$$E_{+i}^{(a)} 1_\lambda \mapsto \begin{array}{ccccccc} \uparrow & \cdots & \uparrow & & \uparrow & & \uparrow \\ k_m & & k_{i+2} & & k_{i+1} & \xrightarrow{a} & k_i & & k_{i-1} & & k_1 \end{array}$$

$$E_{-i}^{(a)} 1_\lambda \mapsto \begin{array}{ccccccc} \uparrow & \cdots & \uparrow & & \uparrow & & \uparrow \\ k_m & & k_{i+2} & & k_{i+1} & \xleftarrow{a} & k_i & & k_{i-1} & & k_1 \end{array}$$

Definition

We call these webs *N -ladders with m uprights*.

The web category

Definition (The web category $\mathcal{W}^\circ(\vec{k}, N)$)

Objects: formal direct sums of N -ladders with m uprights in $W(\vec{k}, N)$.

The web category

Definition (The web category $\mathcal{W}^\circ(\vec{k}, N)$)

Objects: formal direct sums of N -ladders with m uprights in $W(\vec{k}, N)$.

Morphisms: $\text{Hom}(u\{t\}, v) := \text{Ext}(\hat{u}\{t\}, \hat{v})$.

The web category

Definition (The web category $\mathcal{W}^\circ(\vec{k}, N)$)

Objects: formal direct sums of N -ladders with m uprights in $W(\vec{k}, N)$.

Morphisms: $\text{Hom}(u\{t\}, v) := \text{Ext}(\hat{u}\{t\}, \hat{v})$.

Let $\dot{\mathcal{W}}^\circ(\vec{k}, N)$ be the Karoubi envelope.

Definition (M.M.-Yonezawa)

Define

$$\mathcal{W}_\Lambda^\circ := \bigoplus_{\vec{k} \in \Lambda(m,m)_N} \mathcal{W}^\circ(\vec{k}, N).$$

The web category

Definition (M.M.-Yonezawa)

Define

$$\mathcal{W}_\Lambda^\circ := \bigoplus_{\vec{k} \in \Lambda(m,m)_N} \mathcal{W}^\circ(\vec{k}, N).$$

Theorem (M.M.-Yonezawa)

The 2-functor $\Gamma_{m,m,N}$ induces a strong \mathfrak{sl}_m 2-representation on $\mathcal{W}_\Lambda^\circ$, which is equivalent to \mathcal{V}_Λ^p .

The categorification proposition

Definition (M.M.-Yonezawa)

Define the linear map

$$\psi_{\vec{k}, N}: W(\vec{k}, N) \rightarrow K_0^q(\dot{\mathcal{W}}^\circ(\vec{k}, N))$$

by

$$u \mapsto [u]$$

for any N -ladder with m -uprights $u \in W(\vec{k}, N)$.

The categorification proposition

Definition (M.M.-Yonezawa)

Define the linear map

$$\psi_{\vec{k}, N}: W(\vec{k}, N) \rightarrow K_0^q(\mathcal{W}^\circ(\vec{k}, N))$$

by

$$u \mapsto [u]$$

for any N -ladder with m -uprights $u \in W(\vec{k}, N)$.

Proposition (M.M.-Yonezawa)

The map $\psi_{\vec{k}, N}$ is an isomorphism.

Moreover, it intertwines the q -sesquilinear web form and the Euler form.

The case $N = 3$ (joint with Pan and Tubbenhauer)

Consider formal \mathbb{C} -linear combinations of isotopy classes of singular cobordisms, e.g. the *zip* and *unzip*:

The case $N = 3$ (joint with Pan and Tubbenhauer)

Consider formal \mathbb{C} -linear combinations of isotopy classes of singular cobordisms, e.g. the *zip* and *unzip*:

We also allow dots, which cannot cross singular arcs.

The case $N = 3$ (joint with Pan and Tubbenhauer)

Consider formal \mathbb{C} -linear combinations of isotopy classes of singular cobordisms, e.g. the *zip* and *unzip*:

We also allow dots, which cannot cross singular arcs.

Mod out by the ideal generated by $\ell = (3D, NC, S, \Theta)$ and the *closure relation*:

Khovanov's local relations: $\ell = (3D, NC, S, \Theta)$

$$\text{[parallelogram with three dots]} = 0 \quad (2)$$

$$\text{[cylinder]} = - \text{[cup with two dots]} - \text{[cup with one dot]} - \text{[empty cup]} - \text{[cup with two dots (bottom)]} - \text{[cup with one dot (bottom)]} - \text{[empty cup (bottom)]} \quad (3)$$

$$\text{[sphere with equator]} = \text{[sphere with one dot]} = 0, \quad \text{[sphere with two dots]} = -1 \quad (4)$$

$$\text{[sphere with equator and points } \alpha, \beta, \gamma \text{]} = \begin{cases} 1 & (\alpha, \beta, \gamma) = (1, 2, 0) \text{ or a cyclic permutation} \\ -1 & (\alpha, \beta, \gamma) = (2, 1, 0) \text{ or a cyclic permutation} \\ 0 & \text{else} \end{cases} \quad (5)$$

The relations in ℓ suffice to evaluate any closed foam!

The category of foams

Definition

Let Foam_3 be the graded category of webs and foams.

The q -grading of a foam U is defined as

$$q(U) := \chi(\partial U) - 2\chi(U) + 2d + b.$$

The category of foams

Definition

Let Foam_3 be the graded category of webs and foams.

The q -grading of a foam U is defined as

$$q(U) := \chi(\partial U) - 2\chi(U) + 2d + b.$$

Theorem (M.M.-Vaz)

There exists a fully faithful functor

$$\text{Foam}_3 \rightarrow \text{HMF}_3.$$

In particular, we have

$$\text{Foam}_3(u, v) \cong \text{Ext}(\hat{u}, \hat{v}).$$

for any two monomial \mathfrak{sl}_3 webs u, v .

The \mathfrak{sl}_m 2-representation, e.g.

Warning: facets labeled 0 or 3 have to be removed.

A good question

How to define \mathfrak{sl}_N foams in general?

A good question

How to define \mathfrak{sl}_N foams in general?

So far M.M, Stošić and Vaz only did the special case of \mathfrak{sl}_N -foams with facets colored 1,2 and 3.

THANKS!!!
