# OVERVIEW

- The bigger picture and background
- Bousfield lattice substructure
- Quotients of lattices and lattices of quotients
- ► Ring maps, and specific non-Noetherian examples

BACKGROUND	Substructure	Quotients	RING MAPS
00000000	00000	0000	000000000
			/

Let T be a tensor-triangulated category generated by the tensor unit 1.

For example, take T = D(R), where *R* is a commutative ring, D(R) is the derived category of unbounded chain complexes.

The tensor product  $X \land Y := X \otimes_R^L Y$ , and *R* is the unit. Every  $X \in D(R)$  can be built from *R* using triangles, retracts, and coproducts.

Other examples: the stable homotopy category, the stable module category StMod(kG) when *G* is a finite *p*-group and char(k) = p.

BACKGROUND	Substructure	Quotients	RING MAPS
0000000	00000	0000	000000000

# Let $\mathsf{S} \subseteq \mathsf{T}$ be a full subcategory.

## Definition

- 1. S is a *thick subcategory* if it is closed under triangles and retracts (so  $X \coprod Y \in S$  implies  $X, Y \in S$ ).
- 2. th(X) is the smallest thick subcategory containing *X*.
- 3. S is a *localizing subcategory* if it is closed under triangles and coproducts (and hence retracts).
- 4. loc(X) is the smallest localizing subcategory containing X.

Henceforth, let T be a tensor-triangulated category with T = loc(1). The thick subcategory th(1) is the *finite objects*.

Background	Substructure	Quotients	RING MAPS
0000000	00000	0000	000000000

# **BIG GOAL:**

Classify the thick subcategories of finite objects in T, and the localizing subcategories of T.

# Done for:

- ► Thick subcats of finites: the stable homotopy category, D(R), StMod(kG).
- ► Localizing subcats: *D*(*R*) when *R* is Noetherian, *StMod*(*kG*).

Motto: "Localizing subcategories are hard."

BACKGROUND	Substructure	QUOTIENTS	RING MAPS
0000000	00000	0000	000000000

## Question.

Is there a set of localizing subcategories?

The answer is yes for:

- ▶ the stable homotopy category [Okhawa 1989]
- ▶ a Brown category [Dwyer-Palmieri 2001]
- ▶ a well-generated category [Iyengar-Krause 2011]
   − e.g. whenever T = loc(1).
- any category with a combinatorial model structure [Casacuberta-Gutiérrez-Rosický 2012]

## Question.

If there is a set, then what?

Background	Substructure	Quotients	RING MAPS
00000000	00000	0000	000000000

# Definition

The *Bousfield class* of an object  $X \in \mathsf{T}$  is  $\langle X \rangle = \{W \mid W \land X = 0\}$ .

Every Bousfield class is a localizing subcategory [show], so there is a set of them.

Bousfield classes are given a partial ordering by reverse inclusion, so we say  $\langle X \rangle \leq \langle Y \rangle$  when

 $W \wedge Y = 0$  implies  $W \wedge X = 0$ .

Then  $\langle 0 \rangle$  is the minimum, and  $\langle 1 \rangle$  is the maximum [show].

Note that  $\langle X \rangle = \langle 0 \rangle$  if and only if X = 0.

BACKGROUND	SUBSTRUCTURE	QUOTIENTS	RING MAPS
000000000	00000	0000	000000000

There is a join operation given by

$$\bigvee_{i\in I} \langle X_i \rangle := \left\langle \coprod_{i\in I} X_i \right\rangle.$$

There is a meet given by

$$\langle X\rangle \mathrel{,} \langle Y\rangle := \bigvee_{\langle W\rangle \leq \langle X\rangle \text{ and } \langle W\rangle \leq \langle Y\rangle} \langle W\rangle.$$

Thus the collection of Bousfield classes forms a complete lattice, called the *Bousfield lattice* BL(T). We'll do stuff with it.

BACKGROUND	Substructure	Quotients	RING MAPS
0000000000	00000	0000	000000000

## Question.

But is every localizing subcategory a Bousfield class?

This was conjectured for the stable homotopy category in [Hovey-Palmieri 1999].

The answer is yes for D(R) when *R* is Noetherian, and for *StMod*(*kG*) (and slightly more generally).

In October [Stevenson 2012] found a non-Noetherian ring S such that the answer is no for D(S).

BACKGROUND	Substructure	QUOTIENTS	RING MAPS
000000000	00000	0000	000000000

# Theme for Bousfield lattice and localizing subcategories:

When *R* is Noetherian, D(R) is very nice... *too* nice. The stable homotopy category is very hard... and *complicated*.

Some are working to extend the niceness as much as possible. Some are trying to simplify the category of spectra using localizations. Some are looking at non-Noetherian rings. In particular, we know a lot about  $D(\Lambda)$  for

$$\Lambda = \frac{k[x_1, x_2, x_3, \ldots]}{(x_1^{n_1}, x_2^{n_2}, x_3^{n_3} \ldots)},$$

where *k* is a countable field,  $n_i \ge 2$ , and  $deg(x_i) = 2^i$ .

# IN THIS TALK

Let S, T be tensor-triangulated categories generated by their tensor units. Sometimes a functor  $F : S \rightarrow T$  will induce a map of lattices

 $\mathsf{BL}(\mathsf{S}) \to \mathsf{BL}(\mathsf{T}), \text{ where } \langle X \rangle \mapsto \langle FX \rangle.$ 

What can this tell us about BL(S) and BL(T)?

Specifically:

- the Verdier quotient functor  $\pi : \mathsf{T} \to \mathsf{T}/\langle Z \rangle$
- ► a ring map between two commutative rings  $f : R \to S$  induces  $f_{\bullet} : D(R) \to D(S)$  via extension of scalars.

BACKGROUND	SUBSTRUCTURE	Quotients	RING MAPS
00000000	●0000	0000	000000000

# BOUSFIELD LATTICE SUBSTRUCTURE

The tensor (smash) product gives another operation on Bousfield classes:

$$\langle X \rangle \wedge \langle Y \rangle := \langle X \wedge Y \rangle.$$

In general  $\langle X \rangle \land \langle Y \rangle \leq \langle X \rangle \land \langle Y \rangle$ .

Definition

$$\mathsf{DL}(\mathsf{T}) = \{ \langle X \rangle \text{ such that } \langle X \wedge X \rangle = \langle X \rangle \}.$$

This is a sublattice of BL(T).

# Proposition. (Bousfield)

In DL the meet agrees with the smash. Hence DL is a distributive lattice.

Background	SUBSTRUCTURE	QUOTIENTS	RING MAPS
00000000	0000	0000	000000000

## Definition

1.  $\langle X \rangle \in \mathsf{BL}$  is *complemented* if there exists  $\langle X^c \rangle$  such that

$$\langle X \rangle \wedge \langle X^c \rangle = \langle 0 \rangle \text{ and } \langle X \rangle \vee \langle X^c \rangle = \langle \mathbf{1} \rangle.$$

2.  $BA(T) = \{\text{complemented } \langle X \rangle \} \subseteq BL(T).$ 

Note that complements, if they exist, are unique. BA is a Boolean algebra, and

$$\mathsf{BA} \subseteq \mathsf{DL} \subseteq \mathsf{BL}.$$

Background 00000000	SUBSTRUCTURE	Quotients 0000	Ring maps 00000000

What we know:

- If *R* is Noetherian, then in D(R) we have BA = DL = BL.
- In  $D(\Lambda)$ ,  $I\Lambda = \operatorname{Hom}_{k}^{*}(\Lambda, k)$  has  $I\Lambda \wedge I\Lambda = 0$ , so  $\langle I\Lambda \rangle \notin \mathsf{DL}$ .

Furthermore,  $\mathsf{BA} = \{ \langle 0 \rangle, \langle \Lambda \rangle \}.$ 

In the stable homotopy category, the Brown-Comenetz dual *IS*<sup>0</sup> of the sphere has *IS*<sup>0</sup> ∧ *IS*<sup>0</sup> = 0, so DL ⊊ BL.

Every finite spectrum  $\langle F \rangle \in BA$ . But, for example,  $\langle H\mathbb{Z} \rangle \in DL \setminus BA$ .

Background	SUBSTRUCTURE	Quotients	RING MAPS
00000000	00000	0000	000000000

## Definition

For any  $\langle X \rangle \in \mathsf{BL}$ , define

$$a\langle X
angle = \bigvee_{\langle X\wedge Y
angle = \langle 0
angle} \langle Y
angle$$

Note that  $\langle X \rangle \wedge a \langle X \rangle = \langle 0 \rangle$  and  $\langle X \rangle \vee a \langle X \rangle \leq \langle 1 \rangle$ .

#### Lemma. (Bousfield)

- 1. If  $\langle X \rangle$  is complemented, then  $\langle X^c \rangle = a \langle X \rangle$ .
- 2.  $\langle Y \rangle \leq a \langle X \rangle$  if and only if  $\langle Y \rangle \land \langle X \rangle = \langle 0 \rangle$ .[show]
- 3.  $\langle X \rangle \leq \langle Y \rangle$  if and only if  $a \langle X \rangle \geq a \langle Y \rangle$ .
- 4.  $a^2 \langle X \rangle = \langle X \rangle$ .

Background	SUBSTRUCTURE	QUOTIENTS	RING MAPS
00000000	00000	0000	000000000

## Definition

We say  $X \in \mathsf{T}$  is *square-zero* if it is nonzero but  $X \wedge X = 0$ .

Recall  $\langle 0 \rangle \leq \langle X \wedge X \rangle \leq \langle X \rangle$  for all *X*.

# Proposition. (W.)

There are no square-zero objects in T if and only if BA = DL = BL.

Proof. [show]

Background	Substructure	QUOTIENTS	RING MAPS
00000000	00000	●000	000000000

# QUOTIENTS

Given a localizing subcategory S of a tensor-triangulated category T, the Verdier quotient T/S is tensor-triangulated, and the quotient functor  $\pi : T \rightarrow T/S$  is exact.

#### Question.

Does  $\pi$  induce a map on Bousfield lattices?

$$\mathsf{BL}(\mathsf{T}) \to \mathsf{BL}(\mathsf{T}/\mathsf{S}), \text{ where } \langle X \rangle \mapsto \langle \pi X \rangle.$$

[Aside:  $\pi(\langle X \rangle)$  is not usually triangulated.] Does  $\langle X \rangle = \langle Y \rangle$  imply  $\langle \pi X \rangle = \langle \pi Y \rangle$ ? Does  $\langle X \rangle \leq \langle Y \rangle$  imply  $\langle \pi X \rangle \leq \langle \pi Y \rangle$ ? In general, no. However:

# Proposition. (W.)

Suppose  $S = \langle Z \rangle$  for some  $\langle Z \rangle$ . Then  $\pi : T \to T/\langle Z \rangle$  induces an order-preserving map of lattices  $BL(T) \to BL(T/\langle Z \rangle)$ .

Background	SUBSTRUCTURE	QUOTIENTS	RING MAPS
00000000	00000	000	00000000

# Definition

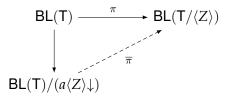

We can form a quotient lattice  $\mathsf{BL}/\langle X \rangle \downarrow$  of equivalence classes of Bousfield classes, where  $[\langle Y \rangle] = [\langle Z \rangle]$  if and only if  $\langle Y \rangle \lor \langle X \rangle = \langle Z \rangle \lor \langle X \rangle$ .

Likewise  $[\langle Y \rangle] \leq [\langle Z \rangle]$  in BL/ $\langle X \rangle \downarrow$  if and only if  $\langle Y \rangle \lor \langle X \rangle \leq \langle Z \rangle \lor \langle X \rangle$  in BL.

There is an isomorphism of lattices  $\mathsf{BL}/\langle X \rangle \downarrow \xrightarrow{\sim} \langle X \rangle \uparrow$ , given by  $[\langle Y \rangle] \mapsto \langle Y \rangle \lor \langle X \rangle$ .

Background	SUBSTRUCTURE	QUOTIENTS	RING MAPS
00000000	00000	0000	000000000

The picture is this:

#### Proposition. (W.)

The map  $\overline{\pi} : [\langle X \rangle] \mapsto \langle \pi X \rangle$  is a well-defined, order-preserving epimorphism of lattices, such that if  $\overline{\pi}[\langle X \rangle] = \langle 0 \rangle$  then  $[\langle X \rangle] = [\langle 0 \rangle]$ .

Background	Substructure	QUOTIENTS	RING MAPS
00000000	00000	0000	000000000

# Proposition. (W.)

If  $\langle Z \rangle$  is complemented, then this is an isomorphism

$$\langle Z^c \rangle \uparrow \cong \mathsf{BL}(\mathsf{T}) / \langle Z^c \rangle \downarrow \xrightarrow{\sim} \mathsf{BL}(\mathsf{T} / \langle Z \rangle).$$

## Corollary. (W.)

If there are no square-zero objects in T, then  $\overline{\pi}$  is an isomorphism for all  $\langle Z \rangle$ .

## Proposition. (W.)

If  $\langle Z \rangle \in \mathsf{DL} \setminus \mathsf{BA}$ , then  $\overline{\pi}$  is NOT an isomorphism of lattices.

This is the case with the stable homotopy category, if we take  $\langle Z \rangle = \langle H \mathbb{F}_p \rangle$ . Then, in fact, we have  $IS^0 \in \langle H \mathbb{F}_p \rangle \lor a \langle H \mathbb{F}_p \rangle < \langle 1 \rangle$ . This is also the case in  $D(\Lambda)$ , if we take  $\langle Z \rangle = \langle k \rangle$ . Then we have  $I\Lambda \in \langle k \rangle \lor a \langle k \rangle < \langle 1 \rangle$ .

Background	Substructure	Quotients	RING MAPS
00000000	00000	0000	

RING MAPS

Let  $f : R \to S$  be a ring map between commutative rings. This induces a map on modules, via extension of scalars.

 $f_*: \mathsf{Mod}\text{-}R \to \mathsf{Mod}\text{-}S, \text{ by } M \mapsto M \otimes_R S.$ 

This induces a functor  $f_* : Ch(R) \to Ch(S)$ , which is left adjoint to  $f^* : Ch(S) \to Ch(R)$  induced by the forgetful functor.

By abstract nonsense, there is a pair of adjoint functors on the derived categories

$$f_{\bullet} = L(f_*) : D(R) \rightleftharpoons D(S) : R(f^*) = f^{\bullet}.$$

Background	Substructure	Quotients	RING MAPS
00000000	00000	0000	000000000
00000000	00000	0000	000000

#### Lemma.

- 1.  $f_{\bullet}R = S$
- 2.  $f_{\bullet}$  is exact, and commutes with coproducts

3. 
$$f_{\bullet}(X \wedge Y) = f_{\bullet}X \wedge f_{\bullet}Y$$

4. (Every object is fibrant, so)  $f^{\bullet}(Z) = f^*(Z)$ , and  $f^{\bullet}$  is exact and commutes with products and coproducts.

# In general, $f^{\bullet}(X \wedge Y) \neq f^{\bullet}X \wedge f^{\bullet}Y$ .

# Proposition. (W.)

 $f_{\bullet}$  and  $f^{\bullet}$  induce order-preserving maps on Bousfield lattices

$$f_{\bullet}: \mathsf{BL}_R \to \mathsf{BL}_S, \text{ where } \langle X \rangle \mapsto \langle f_{\bullet}X \rangle, \text{ and }$$

 $f^{\bullet} : \mathsf{BL}_S \to \mathsf{BL}_R$ , where  $\langle Y \rangle \mapsto \langle f^{\bullet}Y \rangle$ .

Background	SUBSTRUCTURE	Quotients	RING MAPS
00000000	00000	0000	0000000000

#### Lemma.

For all  $A \in D(R)$  and  $B \in D(S)$  we have

$$f_{\bullet}A \wedge B = 0$$
 if and only if  $A \wedge f^{\bullet}B = 0$ .

So  $\langle f_{\bullet}X \rangle = \langle 0 \rangle$  iff  $X \wedge f^{\bullet}S = 0$  iff  $\langle X \rangle \leq a \langle f^{\bullet}S \rangle$ .

Definition

$$\langle M_f \rangle = \bigvee_{\langle f_{\bullet} X \rangle = \langle 0 \rangle} \langle X \rangle = \bigvee_{\langle X \land f^{\bullet} S \rangle = \langle 0 \rangle} \langle X \rangle = a \langle f^{\bullet} S \rangle.$$

Then  $\langle f_{\bullet}X \rangle = \langle 0 \rangle$  if and only if  $\langle X \rangle \leq \langle M_f \rangle$ , i.e.  $Kerf_{\bullet} = \langle M_f \rangle \downarrow$ .

SUBSTRUCTURE	QUOTIENTS	RING MAPS
00000	0000	000000000
		(
		2

## Lemma. (W.)

The following are equivalent:

1. 
$$f_{\bullet}f^{\bullet}\langle X \rangle = \langle X \rangle$$
 for all  $\langle X \rangle$ 

- 2.  $f^{\bullet}Y \wedge f^{\bullet}X = 0$  if and only if  $f^{\bullet}(Y \wedge X) = 0$
- 3.  $f^{\bullet}\langle Y \wedge X \rangle = \langle f^{\bullet}Y \rangle \wedge \langle f^{\bullet}X \rangle$  for all *Y* and *X*.

## Proposition. (W.)

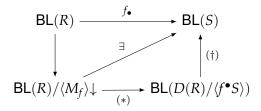

Assume  $\langle f \bullet f \bullet X \rangle = \langle X \rangle$  for all  $\langle X \rangle$ .

- 1.  $f_{\bullet}$  sends  $DL_R$  onto  $DL_S$  and the map  $f^{\bullet}$  injects  $DL_S$  into  $DL_R$ .
- 2.  $f_{\bullet}$  sends  $\mathsf{BA}_R$  onto  $\mathsf{BA}_S$ , and if  $\langle f^{\bullet}S \rangle \vee \langle M_f \rangle = \langle R \rangle$  then  $f^{\bullet}$  injects  $\mathsf{BA}_S$  into  $\mathsf{BA}_R$ .

Background	Substructure	Quotients	RING MAPS
00000000	00000	0000	000000000

Recall 
$$Ker f_{\bullet} = \langle M_f \rangle \downarrow = (a \langle f^{\bullet} S \rangle) \downarrow.$$

The picture is:

The map (\*) is an isomorphism when  $\langle f^{\bullet}S \rangle \vee \langle M_f \rangle = \langle R \rangle$ .

The map (†) exists and is an isomorphism when  $f_{\bullet}f^{\bullet}\langle X \rangle = \langle X \rangle$  for all *X*.

# EXAMPLE WITH SOME NON-NOETHERIAN RINGS

# Definition

Fix a prime *p* and choose  $n_i \ge 2$ . Let  $deg(x_i) = 2^i$  and define the following.

1. 
$$\Lambda_{\mathbb{Z}_{(p)}} = \frac{\mathbb{Z}_{(p)}[x_1, x_2, x_3, \dots]}{(x_1^{n_1}, x_2^{n_2}, x_3^{n_3} \dots)}, \\ \Lambda_{\mathbb{F}_p} = \frac{\mathbb{F}_p[x_1, x_2, x_3, \dots]}{(x_1^{n_1}, x_2^{n_2}, x_3^{n_3} \dots)}, \\ \Lambda_{\mathbb{Q}} = \frac{\mathbb{Q}[x_1, x_2, x_3, \dots]}{(x_1^{n_1}, x_2^{n_2}, x_3^{n_3} \dots)}.$$

2. Let  $g : \Lambda_{\mathbb{Z}_{(p)}} \to \Lambda_{\mathbb{Z}_{(p)}} / p \Lambda_{\mathbb{Z}_{(p)}} = \Lambda_{\mathbb{F}_p}$  be the projection map.

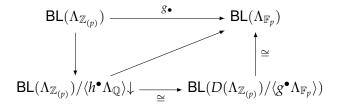

3. Let 
$$h : \Lambda_{\mathbb{Z}_{(p)}} \to \Lambda_{\mathbb{Q}}$$
 be the inclusion map.

4. Let 
$$g_{\bullet} : D(\Lambda_{\mathbb{Z}_{(p)}}) \leftrightarrows D(\Lambda_{\mathbb{F}_p}) : g^{\bullet}$$
 and  $h_{\bullet} : D(\Lambda_{\mathbb{Z}_{(p)}}) \leftrightarrows D(\Lambda_{\mathbb{Q}}) : h^{\bullet}$  be the induced adjoint pairs.

Background	Substructure	QUOTIENTS	RING MAPS
00000000	00000	0000	00000000000

It turns out that  $\langle g^{\bullet} \Lambda_{\mathbb{F}_p} \rangle$  and  $\langle h^{\bullet} \Lambda_{\mathbb{Q}} \rangle$  are a complemented pair in  $\mathsf{BL}(\Lambda_{\mathbb{Z}_{(p)}})$ . Recall that  $\mathsf{BL}(\Lambda_{\mathbb{F}_p})$  and  $\mathsf{BL}(\Lambda_{\mathbb{Q}})$  have no nontrivial complemented classes.

Furthermore,  $\langle g \bullet g \bullet X \rangle = \langle X \rangle$  for all  $X \in D(\Lambda_{\mathbb{F}_p})$ . Thus we get the following picture.

On the other hand,  $\langle h_{\bullet}h^{\bullet}Y \rangle = \langle Y \rangle$  is not true for all  $Y \in D(\Lambda_{\mathbb{Q}})$ .

000000000	00000	0000	0000000
Theorem.	(W.)		
	$BL(\Lambda_{\mathbb{Z}_{(p)}}) \overset{\sim}{\longrightarrow} \langle g^{ullet} \Lambda_{\mathbb{F}_p} \rangle$	$\downarrow \downarrow \times \langle h^{\bullet} \Lambda_{\mathbb{Q}} \rangle \downarrow, $ via	
	$\langle X \rangle \mapsto (\langle X \wedge g^{\bullet} \Lambda_{\mathbb{F}_{p}})$	$\langle \rangle, \langle X \wedge h^{ullet} \Lambda_{\mathbb{Q}} \rangle).$	

DINC MA

From the work we did with quotients, we get the following.

Proposition. (W.)

 $\langle g^{\bullet} \Lambda_{\mathbb{F}_p} \rangle \downarrow \cong \mathsf{BL}(\Lambda_{\mathbb{F}_p}).$ 

In fact, the inclusion functors induce the following isomorphisms.

Lemma. (W.)

$$\mathsf{BL}(\mathsf{loc}(g^{\bullet}\Lambda_{\mathbb{F}_p})) \xrightarrow{\sim} \langle g^{\bullet}\Lambda_{\mathbb{F}_p} \rangle \downarrow \subseteq \mathsf{BL}(\Lambda_{\mathbb{Z}_{(p)}}) \text{ and }$$

 $\mathsf{BL}(\mathsf{loc}(h^{\bullet}\Lambda_{\mathbb{Q}})) \xrightarrow{\sim} \langle h^{\bullet}\Lambda_{\mathbb{Q}} \rangle \downarrow \subseteq \mathsf{BL}(\Lambda_{\mathbb{Z}_{(p)}}).$ 

Background	Substructure	Quotients	RING MAPS
00000000	00000	0000	00000000●

Putting all this together, we get a complete splitting of the Bousfield lattice of  $D(\Lambda_{\mathbb{Z}_{(p)}})$  and its sublattices.

# Theorem. (W.)

$$\begin{aligned} \mathsf{BL}(\Lambda_{\mathbb{Z}_{(p)}}) &\cong \mathsf{BL}(\Lambda_{\mathbb{F}_p}) \times \mathsf{BL}(\mathsf{loc}(h^{\bullet}\Lambda_{\mathbb{Q}})), \\ \mathsf{DL}(\Lambda_{\mathbb{Z}_{(p)}}) &\cong \mathsf{DL}(\Lambda_{\mathbb{F}_p}) \times \mathsf{DL}(\mathsf{loc}(h^{\bullet}\Lambda_{\mathbb{Q}})), \\ \mathsf{BA}(\Lambda_{\mathbb{Z}_{(p)}}) &\cong \mathsf{BA}(\Lambda_{\mathbb{F}_p}) \times \mathsf{BA}(\mathsf{loc}(h^{\bullet}\Lambda_{\mathbb{Q}})). \end{aligned}$$

# Corollary. (W.)

The cardinality of  $\mathsf{BL}(\Lambda_{\mathbb{Z}_{(p)}})$  is  $2^{2^{\aleph_0}}$ .

... Thank you.
