Classify quadratic Poisson structures

What is the Curl Operator?

On a Poisson manifold (M, π) choose a volume form μ:

$$\phi : \mathfrak{X}^k(M) \xrightarrow{\simeq} \Omega^{n-k}(M), \qquad P \longmapsto i_P \mu$$

What is the Curl Operator?

On a Poisson manifold (M, π) choose a volume form μ:

$$\phi : \mathfrak{X}^k(M) \xrightarrow{\simeq} \Omega^{n-k}(M), \qquad P \longmapsto i_P\mu$$

- The **curl operator** is defined as

$$\begin{array}{ccccccccc} D_\mu : & \mathfrak{X}^k(M) & \to & \Omega^{n-k}(M) & \to & \Omega^{n-k+1}(M) & \to & \mathfrak{X}^{k-1}(M) \\ & P & \xrightarrow{\phi} & i_P\mu & \xrightarrow{\mathrm{d}} & \mathrm{d}i_P\mu & \xrightarrow{\phi^{-1}} & \underbrace{D_\mu P}_{\textbf{curl of P}} \end{array}$$

What is the Curl Operator?

On a Poisson manifold (M,π) choose a volume form μ:

$$\phi : \mathfrak{X}^k(M) \xrightarrow{\simeq} \Omega^{n-k}(M), \qquad P \longmapsto i_P\mu$$

- The **curl operator** is defined as

$$\begin{array}{ccccccccc} D_\mu : & \mathfrak{X}^k(M) & \to & \Omega^{n-k}(M) & \to & \Omega^{n-k+1}(M) & \to & \mathfrak{X}^{k-1}(M) \\ & P & \overset{\phi}{\to} & i_P\mu & \overset{\mathrm{d}}{\to} & \mathrm{d}i_P\mu & \overset{\phi^{-1}}{\to} & \underbrace{D_\mu P}_{\textbf{curl of P}} \end{array}$$

- The curl of a vector field is its divergence with respect to μ:

$$D_\mu X = \mathrm{div}_\mu(X) = \frac{\mathcal{L}_X\mu}{\mu}, \quad X \in \mathfrak{X}^1(M).$$

Definition

The modular vector field of (M, π) is the curl of a Poisson bivector π:

$$X_\mu = D_\mu \pi = \phi^{-1}(\mathrm{d} i_\pi \mu).$$

Definition

The modular vector field of (M, π) is the curl of a Poisson bivector π:

$$X_\mu = D_\mu \pi = \phi^{-1}(\mathrm{d} i_\pi \mu).$$

Remark

This modular vector field depends on the choice of μ.

Weinstein geometric approach

Question

Given (M, π) is there a volume form μ invariant under the flow of all hamiltonian vector fields, i.e, such that:

$$\mathcal{L}_{X_f}\mu = 0, \forall f \in C^\infty(M)?$$

Weinstein geometric approach

Question

Given (M, π) is there a volume form μ invariant under the flow of all hamiltonian vector fields, i.e, such that:

$$\mathcal{L}_{X_f}\mu = 0, \forall f \in C^\infty(M)?$$

The modular vector field relative to μ gives:

$$X_\mu f = \mathcal{L}_{X_f}\mu/\mu = \mathrm{div}_\mu \, \pi^\sharp(\mathrm{d}f).$$

Weinstein geometric approach

Question

Given (M, π) is there a volume form μ invariant under the flow of all hamiltonian vector fields, i.e, such that:

$$\mathcal{L}_{X_f}\mu = 0, \forall f \in C^\infty(M)?$$

The modular vector field relative to μ gives:

$$X_\mu f = \mathcal{L}_{X_f}\mu/\mu = \text{div}_\mu \, \pi^\sharp(\mathrm{d}f).$$

- X_μ is a 1-cocycle in Poisson cohomology

$$\mathrm{d}_\pi X_\mu = \mathcal{L}_{X_\mu}\pi = 0.$$

Weinstein geometric approach

Question

Given (M, π) is there a volume form μ invariant under the flow of all hamiltonian vector fields, i.e, such that:

$$\mathcal{L}_{X_f}\mu = 0, \forall f \in C^\infty(M)?$$

The modular vector field relative to μ gives:

$$X_\mu f = \mathcal{L}_{X_f}\mu/\mu = \mathrm{div}_\mu\, \pi^\sharp(\mathrm{d}f).$$

- X_μ is a 1-cocycle in Poisson cohomology

$$\mathrm{d}_\pi X_\mu = \mathcal{L}_{X_\mu}\pi = 0.$$

- If $\nu = f\mu$ then: $X_\nu = X_\mu + \underbrace{\pi^\sharp(-\mathrm{d}\ln|f|)}_{\text{Hamiltonian vector field}}$

Modular Class

Definition

- $\mathrm{mod}(\pi) = [X_\mu] \in H^1_\pi(M)$ is the modular class of (M, π).

Modular Class

Definition

- $\mathrm{mod}(\pi) = [X_\mu] \in H^1_\pi(M)$ is the modular class of (M, π).
- (M, π) is called unimodular if $\mathrm{mod}(\pi) = 0$ (i.e. if there exists a volume form invariant for all Hamiltonian vector fields).

Modular Class

Definition

- $\mathrm{mod}(\pi) = [X_\mu] \in H^1_\pi(M)$ is the modular class of (M,π).
- (M,π) is called unimodular if $\mathrm{mod}(\pi) = 0$ (i.e. if there exists a volume form invariant for all Hamiltonian vector fields).

Remarks

- The Poisson cohomology groups are usually very hard to compute.

Modular Class

Definition

- $\text{mod}(\pi) = [X_\mu] \in H^1_\pi(M)$ is the modular class of (M, π).
- (M, π) is called unimodular if $\text{mod}(\pi) = 0$ (i.e. if there exists a volume form invariant for all Hamiltonian vector fields).

Remarks

- The Poisson cohomology groups are usually very hard to compute.
- The modular class is a basic invariant, with geometric meaning, which is easy to determine in many examples.

Examples

- Any symplectic manifold is unimodular: The Liouville form is invariant under all Hamiltonian flows.

Examples

- Any symplectic manifold is unimodular: The Liouville form is invariant under all Hamiltonian flows.
- $M = \mathfrak{g}^*$ with Lie-Poisson structure π:
  For a translation invariant measure μ, the modular vector field is the modular character of $\mathfrak{g}$:

$$\xi(g) = \operatorname{Tr} \operatorname{ad}_g, \quad g \in \mathfrak{g}.$$

Examples

- Any symplectic manifold is unimodular: The Liouville form is invariant under all Hamiltonian flows.
- $M = \mathfrak{g}^*$ with Lie-Poisson structure π:
  For a translation invariant measure μ, the modular vector field is the modular character of $\mathfrak{g}$:

$$\xi(g) = \operatorname{Tr} \operatorname{ad}_g, \quad g \in \mathfrak{g}.$$

- For a regular Poisson manifold, with transversally oriented symplectic foliation $\mathcal{F}$, one can show:

$$i^*(\operatorname{mod}(\mathcal{F})) = \operatorname{mod}(\pi), \quad i^* : H^1(\mathcal{F}) \to H^1_\pi(M).$$

Cohomology and Homology

- Poisson cohomology $H^\bullet(M,\pi)$: $\mathrm{d}_\pi = [\pi, -]$;

Cohomology and Homology

- Poisson cohomology $H^{\bullet}(M,\pi)$: $\mathrm{d}_\pi = [\pi, -]$;
- Poisson homology $H_{\bullet}(M,\pi)$: $\delta_\pi = [i_\pi, \mathrm{d}]$;

Cohomology and Homology

- Poisson cohomology $H^\bullet(M,\pi)$: $\mathrm{d}_\pi = [\pi, -]$;
- Poisson homology $H_\bullet(M,\pi)$: $\delta_\pi = [i_\pi, \mathrm{d}]$;

Theorem ((Evens,Lu and Weinstein,1998),(Xu,1999))

If (M,π) is unimodular then

$$H_\bullet(M,\pi) \cong H^{n-\bullet}(M,\pi).$$

Holonomy and the modular class

Theorem (Ginzburg and Golubev, 2001)

For any cotangent loop $a : I \to T^*M$:

$$\det h(a) = \exp\left(\int_a \mathrm{mod}\,(\pi)\right).$$

Holonomy and the modular class

Theorem (Ginzburg and Golubev, 2001)

For any cotangent loop $a : I \to T^*M$*:*

$$\det h(a) = \exp\left(\int_a \mathrm{mod}\,(\pi)\right).$$

Remarks

- h denotes the linear Poisson holonomy (defined using parallel transport relative to contravariant version of the Bott connection).

Holonomy and the modular class

Theorem (Ginzburg and Golubev, 2001)

For any cotangent loop $a : I \to T^*M$*:*

$$\det h(a) = \exp\left(\int_a \mathrm{mod}\,(\pi)\right).$$

Remarks

- h denotes the linear Poisson holonomy (defined using parallel transport relative to contravariant version of the Bott connection).
- Integration of Poisson vector field over cotangent paths is invariant under cotangent homotopies.

Following Evans, Lu and Weinstein (1998)

Substitute for volume form: $\eta \otimes \mu$ section of the line bundle $Q_A = \wedge^{\mathrm{top}} A \otimes \wedge^{\mathrm{top}}(T^*M)$.

Following Evans, Lu and Weinstein (1998)

Substitute for volume form: $\eta \otimes \mu$ section of the line bundle $Q_A = \wedge^{\text{top}} A \otimes \wedge^{\text{top}}(T^*M)$.

Definition

The **modular form** of the Lie algebroid A with respect to $\eta \otimes \mu$ is the A-form $\xi_A \in \Omega^1(A)$ defined by

$$\langle \xi_A, X \rangle \eta \otimes \mu = [X, \eta] \otimes \mu + \mu \otimes \mathcal{L}_{\rho(X)} \mu, \quad X \in \Gamma(A).$$

Following Evans, Lu and Weinstein (1998)

Substitute for volume form: $\eta \otimes \mu$ section of the line bundle $Q_A = \wedge^{\text{top}} A \otimes \wedge^{\text{top}}(T^*M)$.

Definition

The **modular form** of the Lie algebroid A with respect to $\eta \otimes \mu$ is the A-form $\xi_A \in \Omega^1(A)$ defined by

$$\langle \xi_A, X \rangle \eta \otimes \mu = [X, \eta] \otimes \mu + \mu \otimes \mathcal{L}_{\rho(X)} \mu, \quad X \in \Gamma(A).$$

- $$\begin{array}{rccl} \nabla: & \Gamma(A) \times \Gamma(Q_A) & \rightarrow & \Gamma(Q_A) \\ & (X, \eta \otimes \mu) & \rightarrow & [X, \eta] \otimes \mu + \eta \otimes \mathcal{L}_{\rho(X)} \mu \end{array}$$
  is a representation of the Lie algebroid A on Q_A.

Following Evans, Lu and Weinstein (1998)

- ξ_A is a 1-cocycle in the Lie algebroid cohomology

$$\mathrm{d}_A \xi_A = 0$$

Following Evans, Lu and Weinstein (1998)

- ξ_A is a 1-cocycle in the Lie algebroid cohomology

$$\mathrm{d}_A \xi_A = 0$$

- If $\eta' \otimes \mu' = f\eta \otimes \mu$ is another section of Q_A then

$$\xi'_A = \xi_A - \underbrace{\mathrm{d}_A \log f}_{\textit{coboundary}} \,.$$

Following Evans, Lu and Weinstein (1998)

- ξ_A is a 1-cocycle in the Lie algebroid cohomology

$$\mathrm{d}_A \xi_A = 0$$

- If $\eta' \otimes \mu' = f \eta \otimes \mu$ is another section of Q_A then

$$\xi'_A = \xi_A - \underbrace{\mathrm{d}_A \log f}_{\textit{coboundary}} .$$

Definition

$[\xi_A] \in H^1(A)$ is the **modular class** of the Lie algebroid A.

Tangent Bundle: $A = TM$

Assume M is orientable.

- $\Gamma(Q_{TM}) = \mathfrak{X}^{\mathrm{top}}(M) \otimes \Omega^{\mathrm{top}}(M)$

Tangent Bundle: $A = TM$

Assume M is orientable.

- $\Gamma(Q_{TM}) = \mathfrak{X}^{\mathrm{top}}(M) \otimes \Omega^{\mathrm{top}}(M)$
- $P \otimes \mu$ such that $\langle \mu, P \rangle = 1$

Tangent Bundle: $A = TM$

Assume M is orientable.

- $\Gamma(Q_{TM}) = \mathfrak{X}^{\text{top}}(M) \otimes \Omega^{\text{top}}(M)$
- $P \otimes \mu$ such that $\langle \mu, P \rangle = 1$
- $\xi_{TM} = 0$

Tangent Bundle: $A = TM$

Assume M is orientable.

- $\Gamma(Q_{TM}) = \mathfrak{X}^{\text{top}}(M) \otimes \Omega^{\text{top}}(M)$
- $P \otimes \mu$ such that $\langle \mu, P \rangle = 1$
- $\xi_{TM} = 0$

If M is orientable then $\mathrm{mod}\, TM = 0$.

Lie algebra: $A = \mathfrak{g}$

A Lie algebra $\mathfrak{g}$ is a Lie algebroid over one point.

Lie algebra: $A = \mathfrak{g}$

A Lie algebra $\mathfrak{g}$ is a Lie algebroid over one point.

- $Q_{\mathfrak{g}} = \wedge^{\text{top}} \mathfrak{g}$

Lie algebra: $A = \mathfrak{g}$

A Lie algebra $\mathfrak{g}$ is a Lie algebroid over one point.

- $Q_{\mathfrak{g}} = \wedge^{\mathrm{top}}\mathfrak{g}$
- The modular form is the adjoint character

$$\langle \xi_{\mathfrak{g}}, g \rangle = \mathrm{Tr}\ \mathrm{ad}_g, \quad g \in \mathfrak{g}.$$

Lie algebra: $A = \mathfrak{g}$

A Lie algebra $\mathfrak{g}$ is a Lie algebroid over one point.

- $Q_{\mathfrak{g}} = \wedge^{\mathrm{top}} \mathfrak{g}$
- The modular form is the adjoint character

$$\langle \xi_{\mathfrak{g}}, g \rangle = \mathrm{Tr}\ \mathrm{ad}_g, \quad g \in \mathfrak{g}.$$

$$\mathrm{mod}\, \mathfrak{g} = \mathrm{mod}\, (\mathfrak{g}^*, \pi_{Lie})$$

Foliation: $A = T\mathcal{F}$

- $T\mathcal{F}$: integrable subbundle of TM with orientable conormal bundle N.

Foliation: $A = T\mathcal{F}$

- $T\mathcal{F}$: integrable subbundle of TM with orientable conormal bundle N.
- $Q_A \cong \wedge^{\text{top}} N$

Foliation: $A = T\mathcal{F}$

- $T\mathcal{F}$: integrable subbundle of TM with orientable conormal bundle N.
- $Q_A \cong \wedge^{\mathrm{top}} N$

$$\mathrm{mod}\, T\mathcal{F} = \mathrm{mod}\, \mathcal{F}.$$

Poisson manifold: $A = T^*M$

- (M, π) is a Poisson manifold

Poisson manifold: $A = T^*M$

- (M, π) is a Poisson manifold
- T^*M is a Lie algebroid over M with anchor $\rho = \pi^\sharp$ and Lie bracket

$$[\alpha, \beta] = \mathcal{L}_{\pi^\sharp\alpha}\beta - \mathcal{L}_{\pi^\sharp\beta}\alpha - \mathrm{d}\pi(\alpha, \beta), \quad \alpha, \beta \in \Omega^1(M).$$

Poisson manifold: $A = T^*M$

- (M, π) is a Poisson manifold
- T^*M is a Lie algebroid over M with anchor $\rho = \pi^\sharp$ and Lie bracket

$$[\alpha, \beta] = \mathcal{L}_{\pi^\sharp\alpha}\beta - \mathcal{L}_{\pi^\sharp\beta}\alpha - \mathrm{d}\pi(\alpha, \beta), \quad \alpha, \beta \in \Omega^1(M).$$

$$\mathrm{mod}\, T^*M = 2\mathrm{mod}\,(\pi)$$

Cohomology and Homology

- Pairing between $\underbrace{H^\bullet(A, \mathrm{d}_A)}_{\text{trivial coefficients}}$ and $\underbrace{H^{r-\bullet}(A, Q_A)}_{\text{coefficients on } Q_A}$,

Cohomology and Homology

- Pairing between $\underbrace{H^\bullet(A, \mathrm{d}_A)}_{\text{trivial coefficients}}$ and $\underbrace{H^{r-\bullet}(A, Q_A)}_{\text{coefficients on } Q_A}$,
- (M, π) Poisson manifold.

Pairing $H_\bullet(M)$ and $H_{n-\bullet}(M, \pi)$

- P. Xu (1999) relates the study of modular vector fields on Poisson manifold with the notion of Gerstenhaber algebra.

- P. Xu (1999) relates the study of modular vector fields on Poisson manifold with the notion of Gerstenhaber algebra.
- Y. Kosmann-Schwarzbach (2000) use this to define a modular vector field for triangular Lie bialgebroids.

- P. Xu (1999) relates the study of modular vector fields on Poisson manifold with the notion of Gerstenhaber algebra.
- Y. Kosmann-Schwarzbach (2000) use this to define a modular vector field for triangular Lie bialgebroids.
- Extended to Lie-Rienart algebras by Huebschmann (1999).

Generators of Gerstenhaber algebras

Definition

An operator ∂ of degree -1 is a **generator of the Gerstenhaber algebra** $\mathfrak{X}(A)$ if, for $P \in \mathfrak{X}^p(A)$, $Q \in \mathfrak{X}(A)$,

$$[P, Q] = (-1)^p \left(\partial(P \wedge Q) - \partial P \wedge Q - (-1)^p P \wedge \partial Q\right).$$

If $\partial^2 = 0$ then $\mathfrak{X}(A)$ is **exact** or a Batalin-Vilkosky algebra.

Generators of Gerstenhaber algebras

Definition

An operator ∂ of degree -1 is a **generator of the Gerstenhaber algebra** $\mathfrak{X}(A)$ if, for $P \in \mathfrak{X}^p(A)$, $Q \in \mathfrak{X}(A)$,

$$[P, Q] = (-1)^p \left(\partial(P \wedge Q) - \partial P \wedge Q - (-1)^p P \wedge \partial Q\right).$$

If $\partial^2 = 0$ then $\mathfrak{X}(A)$ is **exact** or a Batalin-Vilkosky algebra.

P. Xu (1999)

Let ∂ and ∂' be two generators of the Gerstenhaber algebra $\mathfrak{X}(A)$, such that $\partial^2 = \partial'^2 = 0$. Then

$$\partial - \partial' = i_\alpha,$$

for a closed 1-form $\alpha \in \Gamma(A^*)$.

What happens with triangular Lie bialgebroids?

- $P \in \mathfrak{X}^2(A)$ a Poisson bivector: $[P, P] = 0$;

What happens with triangular Lie bialgebroids?

- $P \in \mathfrak{X}^2(A)$ a Poisson bivector: $[P, P] = 0$;
- A^* is also a Lie algebroid;

What happens with triangular Lie bialgebroids?

- $P \in \mathfrak{X}^2(A)$ a Poisson bivector: $[P, P] = 0$;
- A^* is also a Lie algebroid;
- $\partial_P = [i_P, \mathrm{d}_A] = i_A \mathrm{d}_A - \mathrm{d}_A i_A$ is a generator of $\Omega(A) = \mathfrak{X}(A^*)$.

What happens with triangular Lie bialgebroids?

- $P \in \mathfrak{X}^2(A)$ a Poisson bivector: $[P, P] = 0$;
- A^* is also a Lie algebroid;
- $\partial_P = [i_P, \mathrm{d}_A] = i_A \mathrm{d}_A - \mathrm{d}_A i_A$ is a generator of $\Omega(A) = \mathfrak{X}(A^*)$.

Let μ be a top-section of A^*. It defines another generator of $\Omega(A)$:

$$\partial_{P,\mu} = -\phi \mathrm{d}_P \phi^{-1}$$

where $\phi Q = i_Q \mu$, $Q \in \mathfrak{X}(A)$.

The **modular vector field** of a triangular Lie bialgebroid associated with μ is the vector field X_μ given by

$$\partial_{P,\mu} - \partial_P = i_{X_\mu}.$$

The **modular vector field** of a triangular Lie bialgebroid associated with μ is the vector field X_μ given by

$$\partial_{P,\mu} - \partial_P = i_{X_\mu}.$$

- $\mathrm{d}_P X_\mu = 0$;

The **modular vector field** of a triangular Lie bialgebroid associated with μ is the vector field X_μ given by

$$\partial_{P,\mu} - \partial_P = i_{X_\mu}.$$

- $\mathrm{d}_P X_\mu = 0$;
- $X_{f\mu} = X_\mu + \mathrm{d}_P \ln |f|$;

The **modular vector field** of a triangular Lie bialgebroid associated with μ is the vector field X_μ given by

$$\partial_{P,\mu} - \partial_P = i_{X_\mu}.$$

- $\mathrm{d}_P X_\mu = 0$;
- $X_{f\mu} = X_\mu + \mathrm{d}_P \ln|f|$;

$\mathrm{mod}\,(A, P) = [X_\mu] \in H^1(A^*)$ is the **modular class** of (A, P).

The **modular vector field** of a triangular Lie bialgebroid associated with μ is the vector field X_μ given by

$$\partial_{P,\mu} - \partial_P = i_{X_\mu}.$$

- $\mathrm{d}_P X_\mu = 0$;
- $X_{f\mu} = X_\mu + \mathrm{d}_P \ln|f|$;

$\mathrm{mod}\,(A,P) = [X_\mu] \in H^1(A^*)$ is the **modular class** of (A,P).

- If (A,P) unimodular then

$$H_\bullet(A,\delta_P) \cong H^{\mathrm{top}\,-\bullet}(A,\mathrm{d}_A).$$

Relation between the two generalizations

- If (M, π) is Poisson manifold:

$$\mathrm{mod}\,(TM, \pi) = \mathrm{mod}\,(\pi) = \frac{1}{2}\mathrm{mod}\; T^*M.$$

Relation between the two generalizations

- If (M, π) is Poisson manifold:

$$\operatorname{mod}(TM, \pi) = \operatorname{mod}(\pi) = \frac{1}{2}\operatorname{mod} T^*M.$$

- For general triangular bialgebroids

$$\operatorname{mod}(A, P) \neq \frac{1}{2}\operatorname{mod} A^*$$

.

Y. Kosmann-Schwarzbach and A. Weinstein (2005)

The **relative modular class** of the Lie algebroid morphism $\varphi : A \to B$ is

$$\mathrm{mod}^{\varphi}(A, B) = \mathrm{mod}\, A - \varphi^*(\mathrm{mod}\, B)$$

Y. Kosmann-Schwarzbach and A. Weinstein (2005)

The **relative modular class** of the Lie algebroid morphism $\varphi : A \to B$ is

$$\mathrm{mod}^{\varphi}(A, B) = \mathrm{mod}\, A - \varphi^*(\mathrm{mod}\, B)$$

- $\mathrm{mod}^{\rho_A}(A, TM) = \mathrm{mod}\, A.$

Y. Kosmann-Schwarzbach and A. Weinstein (2005)

The **relative modular class** of the Lie algebroid morphism $\varphi : A \to B$ is

$$\operatorname{mod}^{\varphi}(A, B) = \operatorname{mod} A - \varphi^*(\operatorname{mod} B)$$

- $\operatorname{mod}^{\rho_A}(A, TM) = \operatorname{mod} A$.
- $\operatorname{mod}^{P^\sharp}(A^*, A) = 2 \operatorname{mod}(A, P)$.

Nijenhuis operators

- $N \equiv$ Nijenhuis operator of A;

Nijenhuis operators

- $N \equiv$ Nijenhuis operator of A;
- $A_N = (A, \rho \circ N, [\,,\,]_N)$ is a Lie algebroid,

$$[X,Y]_N = [NX,Y] + [X,NY] - N[X,Y], \quad X,Y \in \mathfrak{X}^1(A).$$

Nijenhuis operators

- $N \equiv$ Nijenhuis operator of A;
- $A_N = (A, \rho \circ N, [\,,\,]_N)$ is a Lie algebroid,

$$[X, Y]_N = [NX, Y] + [X, NY] - N[X, Y], \quad X, Y \in \mathfrak{X}^1(A).$$

- $N : A_N \to A$ is a Lie algebroid morphism;

Nijenhuis operators

- $N \equiv$ Nijenhuis operator of A;
- $A_N = (A, \rho \circ N, [\,,\,]_N)$ is a Lie algebroid,

$$[X, Y]_N = [NX, Y] + [X, NY] - N[X, Y], \quad X, Y \in \mathfrak{X}^1(A).$$

- $N : A_N \to A$ is a Lie algebroid morphism;

Theorem

Fix $\eta \otimes \mu$ section of $Q_A \wedge \mathrm{top}(A) \otimes \wedge^{\mathrm{top}}(T^*M)$. Then

$$\xi_{A_N} = \mathrm{d}_A(\mathrm{Tr}\, N) + N^* \xi_A.$$

- The 1-form

$$\xi_{A_N} - N^*\xi_A = \mathrm{d}_A \mathrm{Tr}\, N$$

is independent of the choice of section of Q_A.

- The 1-form

$$\xi_{A_N} - N^* \xi_A = \mathrm{d}_A \mathrm{Tr}\, N$$

is independent of the choice of section of Q_A.

$[\mathrm{d}_A \mathrm{Tr}\, N] \in H^1(A_N)$ is the relative modular class of the Lie algebroid morphism $N : A_N \to A$.

(A, P, N): Poisson-Nijenhuis Lie algebroid

$$\begin{array}{ccc}
(A^*, [\cdot,\cdot]_{NP}) & \xrightarrow{\quad N^* \quad} & (A^*, [\cdot,\cdot]_P) \\
\Big\downarrow P^\sharp & \searrow^{NP^\sharp} & \Big\downarrow P^\sharp \\
(A, [\cdot,\cdot]_N) & \xrightarrow{\quad N \quad} & (A, [\cdot,\cdot]_A)
\end{array}$$

- N^* is a Nijenhuis operator of the dual Lie algebroid

$$(A^*, [\ ,\ ]_P\, , \rho \circ P^\sharp).$$

- N^* is a Nijenhuis operator of the dual Lie algebroid

$$(A^*, [\ ,\ ]_P, \rho \circ P^\sharp).$$

- The relative modular class of N^* has the canonical representative $\mathrm{d}_P(\mathrm{Tr}\, N^*)$, so that:

$$\mathrm{mod}^{N^*}(A^*_{N^*}, A^*) = [\mathrm{d}_P(\mathrm{Tr}\, N^*)] = [\mathrm{d}_P(\mathrm{Tr}\, N)].$$

- N^* is a Nijenhuis operator of the dual Lie algebroid

$$(A^*, [\ ,\ ]_P, \rho \circ P^\sharp).$$

- The relative modular class of N^* has the canonical representative $\mathrm{d}_P(\mathrm{Tr}\, N^*)$, so that:

$$\mathrm{mod}^{N^*}(A^*_{N^*}, A^*) = [\mathrm{d}_P(\mathrm{Tr}\, N^*)] = [\mathrm{d}_P(\mathrm{Tr}\, N)].$$

Definition

The **modular vector field** of the Poisson-Nijenhuis Lie algebroid (A, P, N) is

$$X_{(N,P)} = \xi_{A^*_{N^*}} - N\xi_{A^*} = \mathrm{d}_P(\mathrm{Tr}\, N) = -P^\sharp(\mathrm{d}_A \mathrm{Tr}\, N) \in \Gamma(A).$$

Theorem

Suppose N is non-degenerated Nijenhuis operator.

- $X_{(N,P)}$ *is a* d_{NP}*-coboundary;*

Theorem

Suppose N is non-degenerated Nijenhuis operator.

- $X_{(N,P)}$ *is a* d_{NP}*-coboundary;*
- *A hierarchy of vector fields*

$$X_{(N,P)}^{i+j} = N^{i+j-1} X_{(N,P)} = \mathrm{d}_{N^i P} h_j = \mathrm{d}_{N^j P} h_i, \quad (i, j \in \mathbb{Z})$$

where $h_0 = \ln(\det N)$ *and* $h_i = \frac{1}{i} \mathrm{Tr}\, N^i, \quad (i \neq 0);$

Theorem

Suppose N is non-degenerated Nijenhuis operator.

- $X_{(N,P)}$ *is a* d_{NP}*-coboundary;*
- *A hierarchy of vector fields*

$$X^{i+j}_{(N,P)} = N^{i+j-1} X_{(N,P)} = \mathrm{d}_{N^i P} h_j = \mathrm{d}_{N^j P} h_i, \quad (i, j \in \mathbb{Z})$$

  where $h_0 = \ln(\det N)$ *and* $h_i = \frac{1}{i} \mathrm{Tr}\, N^i, \quad (i \neq 0)$;
- *A hierarchy of vector fields on M given by:*

$$X_{i+j} = -\pi_i^\sharp \mathrm{d}h_j = -\pi_j^\sharp \mathrm{d}h_i \quad (i, j \in \mathbb{Z})$$

  where π_j *are Poisson structures on M.*

The hierarchy of modular vector fields $X_{(N^i,P)}$ is generated by the Nijenhuis operator N.

The hierarchy of modular vector fields $X_{(N^i,P)}$ is generated by the Nijenhuis operator N.

BUT

The hierarchy of modular vector fields $X_{(N^i,P)}$ is generated by the Nijenhuis operator N.

BUT

The covered hierarchy of bi-Hamiltonian vector fields on M may not be generated by any Nijenhuis operator.

The two canonical examples

- Tangent bundle:
  P. Damianou and R. L. Fernandes [arXiv:math/0607784]
  Y. Kosmann and F. Magri [arXiv:math/0611202].
- Lie algebra $(\mathfrak{g}, r, N)$:
  N defines a sequence of modular forms on $\mathfrak{g}^*$, $\xi_{\mathfrak{g}^*_{N^k *}}$, which are associated with the higher brackets on $\mathfrak{g}^*$.

Relation between modular forms of $\mathfrak{g}^*$

$$\xi_{\mathfrak{g}^*_{N^k *}} = N^k \, \xi_{\mathfrak{g}^*_{N*}} .$$

Jacobi algebroid

A **Jacobi algebroid** is a Lie algebroid A equipped with a closed 1-form ϕ

Jacobi algebroid

A **Jacobi algebroid** is a Lie algebroid A equipped with a closed 1-form ϕ

Schouten-Jacobi bracket on $\mathfrak{X}(A)$:

$$[P,Q]^{\phi} = [P,Q] + (p-1)P \wedge i_{\phi}Q - (-1)^{p-1}(q-1)i_{\phi}P \wedge Q,$$

for $P \in \mathfrak{X}^{p}(A), Q \in \mathfrak{X}^{q}(A)$.

Poissonization

Consider the Lie algebroid $\hat{A} = A \times \mathbb{R}$ over $M \times \mathbb{R}$, with Lie bracket

$$[X, Y]_{\hat{A}} = [X, Y], \quad X, Y \in \mathfrak{X}(A),$$

Poissonization

Consider the Lie algebroid $\hat{A} = A \times \mathbb{R}$ over $M \times \mathbb{R}$, with Lie bracket

$$[X, Y]_{\hat{A}} = [X, Y], \quad X, Y \in \mathfrak{X}(A),$$

and anchor

$$\hat{\rho}(X) = \rho(X) + \langle \phi, X \rangle \frac{\partial}{\partial t}, \quad X \in \mathfrak{X}^1(A). \tag{1}$$

Poissonization

Consider the Lie algebroid $\hat{A} = A \times \mathbb{R}$ over $M \times \mathbb{R}$, with Lie bracket

$$[X, Y]_{\hat{A}} = [X, Y], \quad X, Y \in \mathfrak{X}(A),$$

and anchor

$$\hat{\rho}(X) = \rho(X) + \langle \phi, X \rangle \frac{\partial}{\partial t}, \quad X \in \mathfrak{X}^1(A). \tag{1}$$

induced Lie algebroid structure from A by ϕ.

Poissonization

- $\phi = \hat{\mathrm{d}}t$;

Poissonization

- $\phi = \hat{\mathrm{d}}t$;
- $\tilde{P} = e^{-(p-1)t}P, \quad P \in \mathfrak{X}^p(A)$;

Poissonization

- $\phi = \hat{\mathrm{d}} t$;
- $\tilde{P} = e^{-(p-1)t} P, \quad P \in \mathfrak{X}^p(A)$;
- $\left[\tilde{P}, \tilde{Q}\right]_{\hat{A}} = \widetilde{[P, Q]^{\phi}}$;

Poissonization

- $\phi = \hat{\mathrm{d}}t$;
- $\tilde{P} = e^{-(p-1)t}P, \quad P \in \mathfrak{X}^p(A)$;
- $\left[\tilde{P}, \tilde{Q}\right]_{\hat{A}} = \widetilde{[P, Q]^{\phi}}$;
- $[P, P]^{\phi} = 0 \Longleftrightarrow \tilde{P} = e^{-t}P$ a Poisson bivector of $\hat{A}$

Poissonization

- $\phi = \hat{\mathrm{d}}t;$
- $\tilde{P} = e^{-(p-1)t}P, \quad P \in \mathfrak{X}^p(A);$
- $\left[\tilde{P}, \tilde{Q}\right]_{\hat{A}} = \widetilde{[P, Q]^{\phi}};$
- $[P, P]^{\phi} = 0 \iff \tilde{P} = e^{-t}P$ a Poisson bivector of $\hat{A}$

$$(\hat{A}^*, [\,,\,]_{\tilde{P}}, \hat{\rho} \circ \tilde{P}^{\sharp}) \text{ is a Lie algebroid}$$

Poissonization

- $\widehat{\alpha} = e^t \alpha, \quad \alpha \in \Omega^1(A);$

Poissonization

- $\widehat{\alpha} = e^t \alpha, \quad \alpha \in \Omega^1(A);$
- $\left[\widehat{\alpha}, \widehat{\beta}\right]_{\tilde{P}} = e^t \underbrace{(\mathcal{L}^{\phi}_{P^\sharp \alpha}\beta - \mathcal{L}^{\phi}_{P^\sharp \beta}\alpha - \mathrm{d}^{\phi} P(\alpha, \beta))}_{[\alpha,\beta]_P}$

Poissonization

- $\widehat{\alpha} = e^t \alpha, \quad \alpha \in \Omega^1(A);$
- $\left[\widehat{\alpha}, \widehat{\beta}\right]_{\tilde{P}} = e^t \underbrace{(\mathcal{L}^{\phi}_{P^\sharp \alpha}\beta - \mathcal{L}^{\phi}_{P^\sharp \beta}\alpha - \mathrm{d}^{\phi} P(\alpha, \beta))}_{[\alpha,\beta]_P}$
- $(A^*, [\,,\,]_P, \rho \circ P^\sharp)$ is a Lie algebroid;

Poissonization

- $\widehat{\alpha} = e^t \alpha, \quad \alpha \in \Omega^1(A)$;
- $\left[\widehat{\alpha}, \widehat{\beta}\right]_{\tilde{P}} = e^t \underbrace{(\mathcal{L}^{\phi}_{P^\sharp \alpha}\beta - \mathcal{L}^{\phi}_{P^\sharp \beta}\alpha - \mathrm{d}^{\phi} P(\alpha, \beta))}_{[\alpha,\beta]_P}$
- $(A^*, [\,,\,]_P\,, \rho \circ P^\sharp)$ is a Lie algebroid;
- N Nijenhuis operator of $A \Longrightarrow N$ Nijenhuis operator of $\hat{A}$

Poissonization

- $\widehat{\alpha} = e^t \alpha, \quad \alpha \in \Omega^1(A);$
- $\left[\widehat{\alpha}, \widehat{\beta}\right]_{\tilde{P}} = e^t \underbrace{\left(\mathcal{L}^{\phi}_{P^\sharp \alpha}\beta - \mathcal{L}^{\phi}_{P^\sharp \beta}\alpha - \mathrm{d}^{\phi} P(\alpha, \beta)\right)}_{[\alpha,\beta]_P}$
- $(A^*, [\,,\,]_P, \rho \circ P^\sharp)$ is a Lie algebroid;
- N Nijenhuis operator of $A \Longrightarrow N$ Nijenhuis operator of $\hat{A}$

Definition

(A, ϕ, P, N) is a **Jacobi-Nijenhuis algebroid** if $(\hat{A}, \tilde{P}, N)$ is a Poisson-Nijenhuis algebroid.

$(\hat{A}, \tilde{P}, N)$ has a modular vector field

$$\hat{X}_{(N,\tilde{P})} = \xi_{\hat{A}^*_{N^*}} - N\xi_{\hat{A}^*} = e^{-t}\mathrm{d}_P(\mathrm{Tr}\, N).$$

$(\hat{A}, \tilde{P}, N)$ has a modular vector field

$$\hat{X}_{(N,\tilde{P})} = \xi_{\hat{A}^*_{N^*}} - N\xi_{\hat{A}^*} = e^{-t}\mathrm{d}_P(\mathrm{Tr}\, N).$$

Definition

The **modular vector field** of the Jacobi-Nijenhuis algebroid (A, ϕ, P, N) is

$$X_{(N,P)} = \xi_{A^*_{N^*}} - N\xi_{A^*}.$$

$(\hat{A}, \tilde{P}, N)$ has a modular vector field

$$\hat{X}_{(N,\tilde{P})} = \xi_{\hat{A}^*_{N^*}} - N\xi_{\hat{A}^*} = e^{-t}\mathrm{d}_P(\mathrm{Tr}\, N).$$

Definition

The **modular vector field** of the Jacobi-Nijenhuis algebroid (A, ϕ, P, N) is

$$X_{(N,P)} = \xi_{A^*_{N^*}} - N\xi_{A^*}.$$

$\mathrm{mod}^{(N,P)} A = \left[X_{(N,P)}\right]$ the **modular class** of (A, ϕ, P, N).

Also...

If N is non-degenerated, then

- $\hat{X}^{i+j}_{(N,\tilde{P})} = N^{i+j-1}\hat{X}_{(N,\tilde{P})} = \mathrm{d}_{N^i\tilde{P}}h_j = \mathrm{d}_{N^j\tilde{P}}h_i \in \Gamma\hat{A}$
- $X^{i+j}_{(N,P)} = N^{i+j-1}X_{(N,P)} = \mathrm{d}_{N^iP}h_j = \mathrm{d}_{N^jP}h_i \in \Gamma(A)$

$$h_0 = \ln(\det N) \quad \text{and} \quad h_i = \frac{1}{i}\mathrm{Tr}\, N^i, \quad (i \neq 0, \quad i,j \in \mathbb{Z}).$$

- These hierarchies cover two hierarchies, one on $M \times \mathbb{R}$ and another one on M.
